Biometric-based Identification

Fingerprint capture is a method of authenticating customers that provides optimal identification accuracy and security.

Biometric fingerprint technology is penetrating the marketplace at an amazing rate, and is replacing older, less efficient customer identification technologies such as barcodes, passwords, devices, and PINs. It improves the user experience and eliminates the security loopholes of using traditional passwords, significantly reducing fraud occurrences.

Main Features

- Register fingerprints for new and current customers

- Search client products using fingerprints

- Identify customers via their fingerprints

- Authorise transactions using customer fingerprints

- Define cases where fingerprint scanning is mandatory

- Configure business processes to prompt for a fingerprint request before a transaction is processed

- Authorise processes based on the user's fingerprint
